**FULL STACK WEB DEVELOPMENT II(CPSC 2650)**

**Final Group Project**

**Due Date: [August 5, 2023](#)**

**Mourad Bouguerra**

[mbouguerra@langara.ca](mailto:mbouguerra@langara.ca)

---

- ❑ This final group project requires you to build a full-stack website using
  - ➡ Front-end languages (HTML5, CSS3, and JavaScript ES6)
  - ➡ Bootstrap front-end framework
  - ➡ Node.js back-end framework
  - ➡ MongoDB back-end database and HTTP (web) server

## Part-I

### Design Patterns

**(45 marks)**

1. At least the following three design patterns must be used
  - (a) The module design patter (5 marks)
  - (b) The Model-View-Controller (MVC) design pattern to develop your full-stack website using the (see figure 1 on page 3) (30 marks)
    - (i) Appropriate modules in models directory (10 marks)
    - (ii) Appropriate modules in views directory (10 marks)
    - (iii) Appropriate modules in controllers directory (10 marks)
  - (c) The factory method to generate the mapper objects of your data (10 marks)

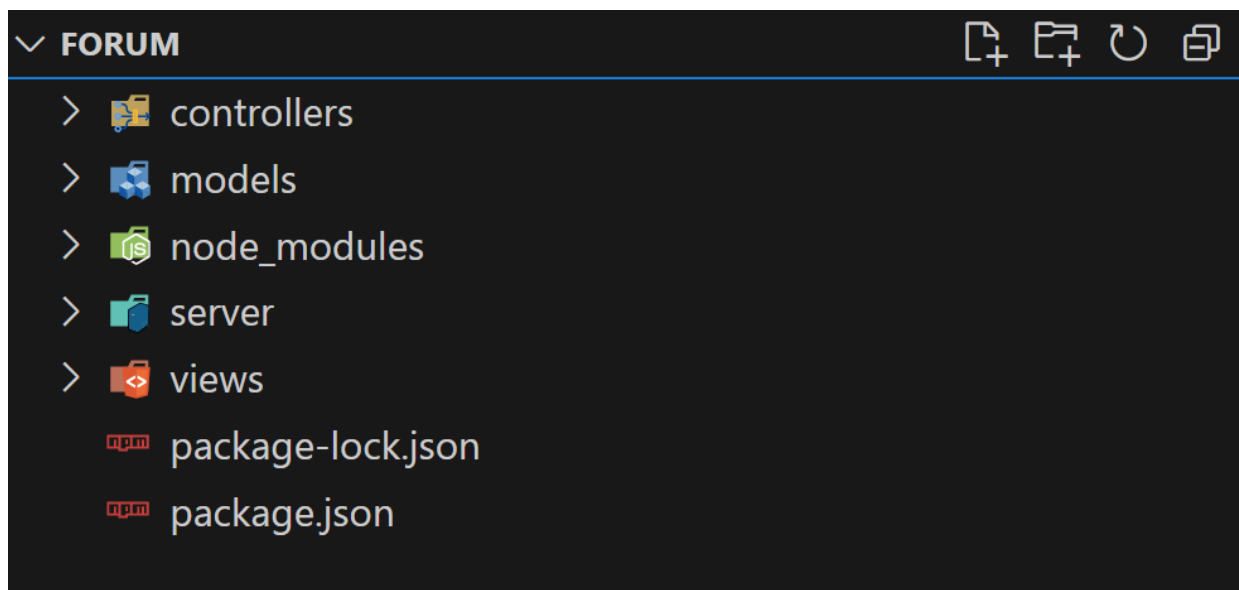

Figure 1: MVC Folder Structure

## Part-II

### Authentication, Authorization, and Accountability (AAA)

(30 marks)

1. Your full-stack website must provide authentication, authorization, and accountability (AAA)
  - (a) Authentication: To access your content, users must be authenticated using a username and password (10 marks)
  - (b) Authorization: Implement authorization by adding three roles: admin, member, and guest (10 marks)
  - (c) Accountability: generates a collection in MongoDB that stores key information for all requests/responses (see figure 2 on page 4) (10 marks)

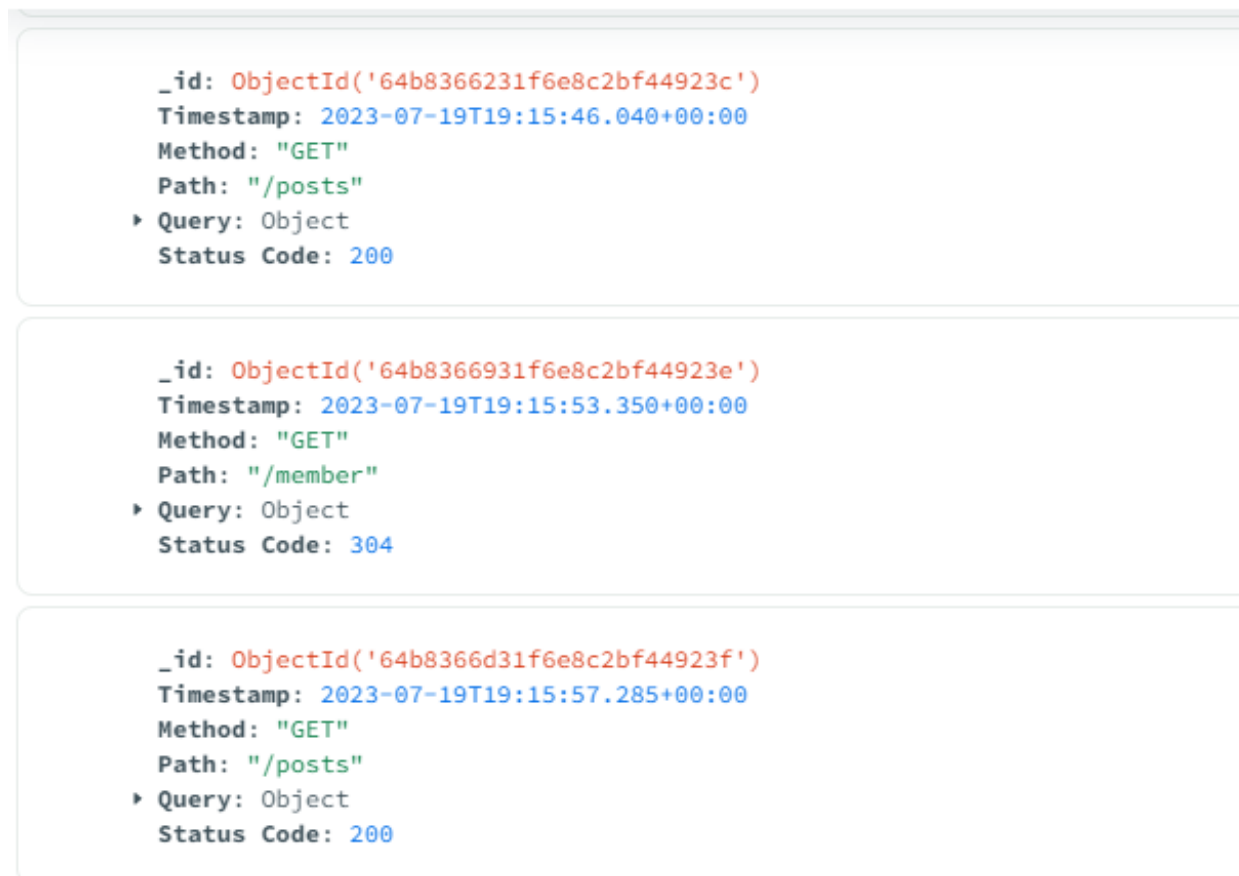

Figure 2: Sample MongoDB Log Collection

## Part-III

### Web APIs

(15 marks)

1. At least one Web API must be used. This web API can be called by passing latitude and longitude as arguments

Listing 1: Example of Web API using Geolocation

```
https://api.openweathermap.org/data/3.0/onecall?lat={lat}&lon={lon}&exclude={part}&appid={API key}
```

- (a) Add appropriate utility function to connect to both local and remote MongoDB server (5 marks)
- (b) Add appropriate utilities functions to implement CRUD operations (10 marks)

**Part-IV**  
**Git Version Control System (VCS)**

**(20 marks)**

1. Use Git VCS with a remote repos<sup>1</sup>
  - (a) Each group member must contribute and commit her/his contributions (10 marks)
  - (b) Effective use of Git VCS (10 marks)

---

<sup>1</sup>Either you can my remote server repos or use a different remote repos and provide me with access to it.

## **Part-V**

### **Minimum Modules Usage**

**(20 marks)**

1. This project can be completed with the following minimum external modules

➡ **express**

➡ **mongodb**

2. textttt-5 marks will be deducted from using any extra module

## Marking Scheme

Task	Marks
Design Patterns	45
AAA	30
Web APIs	15
Git VCS	20
Minimum Modules Usage	20
Usability & Accessibility	20
<b>Total</b>	<b>150</b>

## Submission

-  Upload a text file to Brightspace that provides information how to access your remote repos
